

GCP Identity and Access Management Strategy

Partnered with Fortune 500 organization with their GCP Identity and Access Management (IAM) strategy. The organization was preparing to migrate key business systems into GCP and was concerned about the need for a well-designed and secure IAM environment. Edge was engaged to provide deep expertise and knowledge of IAM, GCP and Cloud Cybersecurity best practices.

- Edge experts started by reviewing the organization's existing IAM policies, procedures, controls and standards to gain a good understanding of their risk framework and expected level of protection.
- Upon completion of the internal review, the team worked to map a crosswalk from existing customer solutions and controls into the GCP environment and the relative controls necessary.
- After the control mapping, the implementation of the customer's test IAM ecosystem within the newly built framework began to ensure it met business needs from a security and operational access perspective.
- Upon successful testing and completion of necessary documentation, the team assisted with educating the customer cybersecurity IAM team with ramping up their knowledge and understanding of the GCP environment to ensure continued long-term success.
- This work allowed the customer to quickly establish a secure environment and react to a critical and time sensitive business need to ramp up for a major project effort.
